

2

## **CONTENT OF PARTS BOX**

- 1. Cargo saddle
- 2. Seatpost 31,6 mm
- 3. Cargo pedals
- 4. Stem 80mm
- 5. Spacers 4x spacer
- 6. Rack bolts (4x)
- 7. Touch up paint

## **CONTENT OF WHEELBOX**

- A. Rear wheel with tube, tire mounted
- **B.** Front wheel with tube and tire mounted
- **C.** 1x160mm 6 bolt rotor with 6 torx-25 rotorbolts and 1x160mm centerlock rotor with a lockring. (in an envelope)
- D. Rear and front fender

2. REMOVE PROFESTIVE MATERIAL Take your new bike out of the box, and remove the protective material. When this is done, flip down the kickstand and let the bike rest on the kickstand and the fork. Turn the inserts on the right hand side. Unscrew the insert from the inside. Turn it around and put it on the inside so the tap goes inside the hole from the inside of the frame. The geardrop should be pointing down. Then use both bolts to mount the drop from the outside. Don't tighten them all the way just yet.

## 3 MOUNT THE COCKPH

(1.)

2.

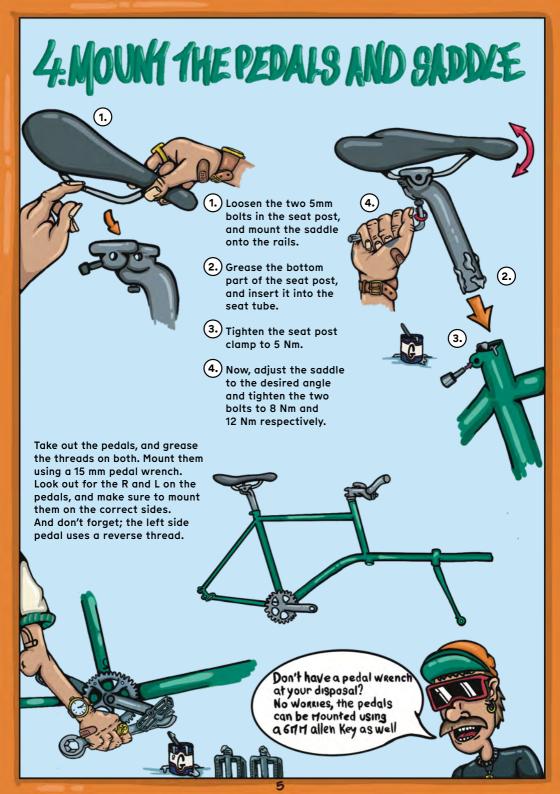

(2.) Add a bit of grease to the top and bottom headset cups, and slide up the steerer, making sure both headset bearings are in place, along with the compression ring and the headset cover.

(3.)

3. Remove the top cap, and put the provided spacers on the steerer. Now put on the stem, and put the top cap back on, tightening it only slightly.

4. Put on the handlebars using the two faceplates to mount it. Use the cross in the middle of the handlebar as a guide to center it. Tighten the faceplate bolts to 5 Nm.

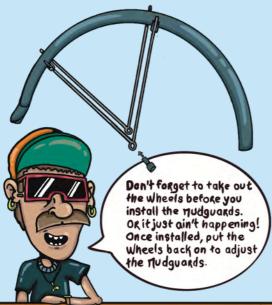

> Don't Worry about aligning the steri just yet. We'll get there soon enough.

## 5. MOUNT THE MUDBUARDS

Attach the two V-stays to the rear mudguard using the provided nuts and bolts. Mount the rear mudguards on the bike using the black T25 torx for the V-stays, and the bolts and washers provided in the bag to fasten the mudguards to the rear triangle.

Attach the two straight stays to the front mudguard using the two nuts and bolts provided.

Tiddle size spacer in the Sort crown Spacers inside the Mudguard

Attach the stays to the front fork using the black T25 torx bolts in the fork. Attach the upper bridge to the fork using the long bolt, the anchor bolt and the washer provided.

When the mudguards have been correctly adjusted, cut off any surplus parts of the stays, and slide the 6 provided, black rubber caps onto the ends for protection from any sharp edges. And for that smooth finish!

Mount the provided 160mm 6 bolt rotor on the front wheel using the 6 torx-25 rotorbolts. Tighten them to 6,2Nm. Look out for the arrows on the rotors, to make sure they are mounted correctly.

a.

No grease on the rotor bolts or the lackring! it might contaminate the rotors.

 Mount the 160mm centerlock rotor on the rear wheel using the lockring and the proper tool. Tighten it to 40Nm

> 2. Remove the protective plastic inserts from the brake calipers. Mount the front wheel first, and make sure to grease the thru axle. Tighten the axle to 10 Nm maximum using a 6mm allen key.

THE WYEELS

When mounting the rear wheel, make sure to have the sliding inserts loose which makes it easier to fit the belt on the front and rear sprocket. Remember the fixing washer and make sure the gear arm on the hub is pointing forward. Then tighten the nuts to 30-45Nm with your 15mm wrench,

if this makes no sense.

Scan the QA code for

a video guide

This bit can be tricky so tenen betricky Patience is a vietue.

Tighten the belt. The easiest way to do this is by using the 15mm wrench and applying pressure on the right hand side nut, which moves the wheel and the sliding inserts back. When the inserts are back and the belt is tight you tighten the inserts with your 6mm allen key.

(5.)

Mounting the gear cable. Pull the outer cable towards the rear to give you something to work with. Cable needs to be mounted in the small hook at the back of the hub and the outer cable is mounted in the arm. It might take some bit of fiddling.

Loosen the bolts in the brake caliper using a 5mm allen kev. (They should already be loose when you receive the bike)

Now, squeeze the brake lever, and while holding the lever squeezed in, tighten the two caliper bolts to 10Nm. This is done to center the rotor between the brake pads.

Spin the wheel to see if the rotor is rubbing. If it is, loosen the bolts, readjust, and tighten. Repeat until satisfied. Both front and rear, obviously.

brake levers and the gear trigger to your liking, or leave 'em as they are!
